

Episode 3 — The Copy-Paste Soup

Programming with Python • Tutorial 03

Kevin has pasted the same receipt code fourteen times, and a ten-cent price change just cost him an afternoon of hunting down copies. In this notebook you give him the cure: the **function**, code you write once and call anywhere. You'll write functions with parameters and return values, learn why a function can't secretly change your variables (**scope**), give a parameter a **default**, and bundle data with behavior in a first **class**. It ends in the Tip Calculator Championship, where the whole class throws weird receipts at each other's tip functions to see whose survives.

Work on the notebook

[Open in browser](#)  Open in molab

Open in browser (recommended): runs entirely on your machine, in this tab: no account, no installation, and after it loads no internet is needed.

! How your work is saved (read this once)

Your progress lives **in this browser tab**. If you **reload** the page (Cmd/Ctrl + R) your work is still there. But if you **close the tab and open the link again later, you start from a clean notebook**. There is no cross-device sync in the browser, and clearing browser data or private mode also wipes it.

So: **download your .py before you leave** (menu → Download → *Download Python code*). That download is the *only* guaranteed copy. Handing in files works exactly like this in the checkpoints, so you get to practice the motion every week. Note: a downloaded **.py** is for submission and backup. You can't upload it back into the browser editor.

Open in molab: marimo's free cloud (account required). Your copy saves to your account and reopens on **any device**. Choose this if you know you'll switch computers or want to be certain nothing is lost. Optional: nothing graded ever requires it.
