Episode 4: The Menu Grows Up

Programming with Python · Tutorial 04

The menu outgrew Tobi. Last week he tracked prices in seventeen loose variables (`price1`, `price2`, and the infamous `price_final_FINAL2`) and nobody could find anything. In this notebook the data finally gets a **shape**: you'll queue orders in a **list**, map dishes to prices in a **dictionary**, count unique regulars with a **set**, reach into **nested** dictionaries, and re-price the whole menu in a single **comprehension**. It ends with a courier run across campus: Tobi's forgotten Falafel Wrap has to reach the dorms before it achieves sentience.

Work on the notebook

Open in browser 

Open in browser (recommended): runs entirely on your machine, in this tab: no account, no installation, and after it loads no internet is needed.

> ! **How your work is saved (read this once)**
> Your progress lives **in this browser tab**. If you **reload** the page (Cmd/Ctrl + R) your work is still there. But if you **close the tab and open the link again later, you start from a clean notebook**. There is no cross-device sync in the browser, and clearing browser data or private mode also wipes it.
>
> So: **download your `.py` before you leave**: press **Cmd/Ctrl+S**, then menu → Download → *Download Python code*. Without the save, the file is empty or misses your last edits. That download is the *only* guaranteed copy. Handing in files works exactly like this in the checkpoints, so you get to practice the motion every week. Note: labs are not graded and nothing is handed in. The downloaded `.py` is your backup. You can't upload it back into the browser editor.

Open in molab: marimo's free cloud (account required). Your copy saves to your account and reopens on **any device**. Choose this if you know you'll switch computers or want to be certain nothing is lost. Optional: nothing graded ever requires it.
