

Episode 1 — The Founding

Programming with Python • Tutorial 01

Your food-delivery startup exists as of today. It has no name (that's your first job), no menu (your second), and a co-founder, Tobi, who has already blown most of the marketing budget on stickers (300 EUR is what's left). In this notebook you set up prices, calculate the first revenues, and decide whether Tobi's 9.99-for-everything pricing theory survives contact with arithmetic.

Work on the notebook

[Open in browser](#)  Open in molab

New here? Read [How the notebook works](#) first: which cells to edit, how to run them, what the verdicts mean.

Open in browser (recommended): runs entirely on your machine, in this tab: no account, no installation, and after it loads no internet is needed.

! How your work is saved (read this once)

Your progress lives **in this browser tab**. If you **reload** the page (Cmd/Ctrl + R) your work is still there. But if you **close the tab and open the link again later, you start from a clean notebook**. There is no cross-device sync in the browser, and clearing browser data or private mode also wipes it.

So: **download your .py before you leave** (top-right notebook menu → Download → *Download Python code*). That download is the *only* guaranteed copy. Handing in files works exactly like this in the checkpoints, so you get to practice the motion every week. Note: a downloaded .py is for submission and backup. You can't upload it back into the browser editor.

Open in molab: marimo's free cloud (account required). Your copy saves to your account and reopens on **any device**. Choose this if you know you'll switch computers or want to be certain nothing is lost. Optional: nothing graded ever requires it.
